The routine  
map\_to\_model will  
interpret a map (cryo-  
EM, low-resolution X-  
ray) and try to build an  
atomic model, ... You  
supply the full map,  
your model of the  
unique part of the  
structure as the  
starting\_model, and  
the symmetry matrices  
that you can obtain  
from the  
map\_symmetry tool.

With higher resolution maps ( $<8 \text{ \AA}$  resolution) secondary structure elements (e.g.,  $\alpha$ -helices) become apparent in the density map and provide a strong constraint for manipulating the homology model. The overall goal is to fill the EM density with the model both while
