Mitosis Notes Cell division occurs in a series of stages, or phases.

- Chromatids (or pairs of chromosomes) separate and begin to move to opposite ends of the cell
- Chromatids (or pairs of chromosomes) attach to the spindle fibers
- Chromosomes are copied (# doubles)
- Chromosomes appear as threadlike coils (chromatin)

Notes- The Cell Cycle & Mitosis Most living things grow by producing more cells. There are two reason that a cell divides 1) The larger a cell gets the more demand that it puts on its DNA. 2) The cell starts to have trouble getting enough nutrients and oxygen into the cell and all the waste out of the cell.

Mitosis is the division of a cell into two daughter cells that are genetically identical to the parent cell. Meiosis is the division of a germ cell into four sex cells (e.g. egg or sperm), each with half the number of chromosomes of the parent cell. Mitosis is a means of asexual reproduction, whereas meiosis is necessary for sexual reproduction.
