Breast Ultrasound is a very common adjunct modality for diagnostic imaging of patients either being called back from a screening exam or those coming into our facilities with clinical symptoms. The job of the breast sonographer is to understand where the area of concern is located on the mammogram and how to correlate it to where they should be scanning in the patient's breast.

The median interval between mammography and diagnostic MR imaging was 22 days (range, 0–100 days); none of these 88 lesions had a mammographic correlate. Mammographic parenchymal density [13] was class 4 (dense) in 18 (20%), class 3 (heterogeneously dense) in 57 (65%), class 2 (scattered fibroglandular densities) in 12 (14%), and class 1 ...
