Application 1 : Exponential Growth - Population Let $P(t)$ be a quantity that increases with time t and the rate of increase is proportional to the same quantity P as follows $dP/dt = kP$ where dP/dt is the first derivative of P , $k > 0$ and t is the time. The solution to the above first order differential equation is given by $P(t) = A e^{kt}$

APPLICATIONS OF DIFFERENTIAL EQUATIONS 5 We can solve this differential equation using separation of variables, though it is a bit difficult. We begin by multiplying through by $P \max P \max dP/dt = kP(P \max P)$: We can now separate to get $Z P \max P(P \max P) dP = Z kdt$: The integral on the left is difficult to evaluate. The secret is to express the fraction as

Therefore, the differential equation describing the orthogonal trajectories is . since the right-hand side of (**) is the negative reciprocal of the right-hand side of (*). If equation (**) is written in the form . note that it is not exact (since $M_y = 2y$ but $N_x = -2y$). However, because . is a function of x alone, the differential ...
